

The Pragaman Files

A biographer's questionnaire — the raw material for your website

How to fill this in (read this first):

- **Messy answers are the best answers.** Voice-note-style rambling, typos, half-Hindi — all perfect. I'll do the polishing.
 - **Specifics beat adjectives.** "I'm hardworking" gives me nothing. "I once rebuilt a whole Figma flow at 2 AM because one button felt 4 pixels off" gives me a website.
 - **Stories are gold.** Anytime a question triggers a memory — even a tiny one — tell the story, don't summarize it.
 - **Skip freely.** If a question sparks nothing, skip it. If it sparks something, over-answer it.
 - **Answer by number** (W1, P7, S2...) so neither of us gets lost.
 - **Mark anything off-limits.** If you tell me something but don't want it on the site, write [PRIVATE] next to it. I'll use it for understanding you, never for publishing.
-

SECTION 1 — WORK

Raw material for the "Want me to work for you" door.

A. Origin of the product person

- **W1.** Why product? Not the LinkedIn answer — the real one. What pulled you toward this instead of pure engineering?

Ans: I really love the idea of thinking about something imagining how that thing can be implemented. Planning the process, Looking into details how that can be improved, giving feedback identifying potential problems. I am more into imagination than technicality. I can learn how those things can be done but I really like the time which I spend in imagining, planning, questioning all the choices and making a robust plan on how we can achieve that thing. I really am not the guy who can code for 10 days. I can't plan things, decide a path describe=be features, convert the requirement into technical terms and all other things. It's more fun for me this way then the other way around. I really like thinking and imagining.

- **W2.** Tell me about the moment you first felt like an actual PM — not an intern, not a helper. Where were you, what happened?

Ans: It's not exactly about a product manager. I am someone who thinks about things and plans in minute details. I am into this job because it offers something different from a 9-6 desk job. It challenges me everyday to think about something different. It makes me feel I have a purpose more than work. In this way i can't feel like work rather than it's a fun problem to solve and come up with ideas. I am not just looking for a PM role that's the least of my concern. I wanna have a job that has a sense of purpose far more than just delivering products to the client. It's about how I should like what I do and have more than just work. I have always been like that person who likes to think before doing anything.

- **W3.** How did the Noboru internship actually happen? The full story — how you found it, the interview, your first week.

Ans: It's my first JOB which I was not at all prepared for. After completing my 6th semester I went home during the summer break and company had just started to come to our college and I filled the form for Noboru. When I was at my home the recruitment process started. This was the first experience for me. I didn't know how but Amidst half the PPT(Pre Placement Talk). I was in control of the meeting. I was the one responsible for clearing the doubts of late comers to the PPT. That was the moment I felt confident that I can do things and I had clarity over what I really wanted to do. And I don't just want to sit and analyse data and show excel sheets. I want to do more than that. I want to build things. I like to think about things, products and companies. I will like to involve in all the aspects of how a brand is built from ideation to tech to marketing to pr all things i wanted to do. Thats what I saw in this role and thats what turend out to be true. Here I have learnt so much more than just skills. I have learnt about handling clients. Making strategy for brand . Taking decisions that will actually affect the brand in ral words. Making software. Managing vendors. Designing website features. Managing marketing and sales funnel. Arranging PR interviews for the brand. Managing social media. Shooting videos. Technical SEO. Preparing PRD. Designing to deploying website. Withing 1 year even before I completed my college I was managing people and interns. Making strategies handling client meetings and everything.. Now coming onto the job interview we were given the assignment after PPT based on which our interview will happen. The assignment about your business idea and how would you implement that business plan. I along with my gf planned everything all night. Then i converted that into Presentation. The idea was about starting a cloud kitchen that will service elderly people//parents that live without there children. So provide them healthy nutrition based homely food at large sacle in metro cities. I

presented my presentation with all clarity like a MBA student thinking about all possible situation that got me selected here.

- **W4.** What did you believe about "product management" before the job that turned out to be completely wrong?

Ans: I had no information about the product management. Everything is new to me and I am enjoying all these.

- **W5.** Was there a specific project, crisis, or win where you thought: *"Okay. This is my thing."*?

Ans: Now in the first month as intern i was told i have to travel to Indore to the clients office as we are making the software. I need to talk with all the departments. GST, Taxation, Accounting, Finance, Compliance, Sales Directors and get their requirement and have to convert that into a proper PRD. That will later be used to develop the Software. I really liked talking with people, understanding their exact requirements then suggesting to them the new ways that things can be done. I talked with different stakeholders for a week. Listing down their requirements and then converting them into actual PRD. It was so fun. Then I had to coordinate the whole process of software development with the development team. I was then involved in designing the UI/UX of the software with the designer then I was responsible for coordinating between the operations team and Development team regarding all the logics and data flow. We have completed the software there were some days where we have some disagreement and days where i felt the development team were not as committed to this thing as I was.

B. How you actually work

- **W6.** Describe your requirement-decomposition method like you're explaining it to a friend over coffee — not resume language. Where did it come from? Did you invent it out of necessity?

How I like to work is i like to identify all sets of possible questions then i assign them into the group then i imagine the flow and then answer every question one by one i ask the most technical to the most basic question so that nothing is left and the use of any thing that i am going to start should be very strong okay.

- **W7.** What are you *unreasonably* rigorous about at work? The thing colleagues might find slightly obsessive.

I am a perfectionist and very discipline person if a task is allotted then i like to complete it without unnecessary excuse if someone procrastinate things i am very cold at that time and ask for reason and try to finish the work because finishing the assigned task is very important for me

- **W8.** What's your honest weakness as a PM right now — the thing you're actively working on?

I can handle people and put my points in a better way i am very less patience when someone repeat the same thing again and again and waste the time instead of accepting mistake and moving to fixing the problem so i can better put my views there and I can be more articulate in those situations.

- **W9.** Walk me through how AI actually fits into your day. Specific workflows: what do you use Claude for vs Cursor vs v0? Give me one real example from last week.

I use AI to automate anything which i have to do more than 3-4 time I identify the pattern and try to make a system that will incorporate all the learnings that i have done in those 3-4 times and reduce the turnaround time for that work and make myself available for other works and do the same thing. Some day ago I had to find the lead prospect for the given set of company then instead of finifing the company one by one i am developing a prospect engine that will find the potential leads for me based on specific condition that will be required populate that in my list so that i can reachout to them via mail and call and in future i would like to automate that first contact when we have enough perosnalized reachout and have covered wode range of industry.

- **W10.** What would each of your 3 team members say it's like working with you? (Guess honestly — including the mildly annoying parts.)

I am obsessive about things

I complete things even before the deadline

I can work and come up with solutions very quickly

I can identify the mistake very fast

I can be very cold when i am not happy

- **W11.** How do you handle it when a client or stakeholder is just... wrong? A real example if you have one.

I am very good at explaining things but if someone keeps getting it wrong and push on the same button again and again then i can be little confronting about it when they are wrong i am currently working on being listening more as i try to interrupt someone when they are wrong. I But I like to be honest about things if someone says falls things then i will protect my team and my work. Someday ago a client told the content written by my team is unprofessional and unacceptable even without having the knowledge of what we are doing and messaged in group but they were wrong to use that type of word as lots of effort goes behind researching and writing things. So first i explained them the whole process then I told them what they said is wrong and they should not use this type of word.

- **W12.** What does your actual workday look like, hour by hour? (Chaos is fine, chaos is content.)

My work day is actually vey chaotic i work in a very small company with not that much person and normally has to handle lots of moving part even when i have planned the day in certain way sometime CEO requirement team meeting client meeting shoot and all variable things change sthe things some day ome is absent then will have to fill up for their work some time some resigns then will have to do their work till someone is hired so it feels more like a mom working in house handling multiple responsibility then just doing planned things so i have to adjust a lot.

C. The proof — case study raw material

Filing Buddy (the 20X story):

- **W13.** Paint the before-picture. What state was their SEO/traffic in when you started? What did the client think was possible?

I have provided this information in the report you can refer to that.

- **W14.** What was your actual strategy — the 3–4 big moves that drove the growth, in plain language?

I identified the pillars then standarize the whole process of blog writing then started to publish the blogs Glossary regularly and the USO universal search optimization was done across social media platform we improved the technical aspects of the website fixed the technical issues of the website increased the audit score and many more things. I researched and made the list of keywords that we will be targeting and started focusing on building the content depth instead of spreading thin.

- **W15.** What almost didn't work? A moment where the numbers were flat and you doubted the approach?

When the website technical issues were a lot and the site loading speed was slow so matter how good the content was no traffic was coming then we identified the tech fixes improved the loading speed researched and integrated the features that will get the more user friendly behaviour.

- **W16.** The moment you saw it turn — do you remember the day you checked Search Console and went "oh, it's happening"? Describe it.

Ya in January 2026 our effort started to give us result with more than 1 million impressions and 6k traffic we started to scale.

- **W17.** The AEO/GEO angle — how did you figure out AI-search optimization before it was a mainstream playbook? What did you actually do?

I had been using the AI previously and when i started writing and planning content then i started to use LLM bait modified the robot.txt started writing EEAT content YMYL was also introduced on our website along with all Standard AAEO practices that are now being followed we started to integrate the PAA and FAQ and tried to explain with examples and illustration.

- **W18.** What did the client say when they saw the results? Any quote or reaction worth keeping?

They were shocked that even AI are referring to our blogs in there Answer and they were Happy that we are having more than 1 million impressions organically a month.

Buddy Software (the SaaS build):

- **W19.** Describe the chaos before the platform — what did the CA firm's workflow actually look like? (WhatsApp threads? Excel hell? Paint the picture.)

When I went to indore there are 7 department all working on different excel sheet then updating on one master sheet and also maintaining individual sheet and everyone has to follow up their clients manually and keeping tracks of deadlines and challans all need to happen manually and that was very disorganised a thing that should take 2 minutes was taking 10 minutes and if someone is absent then it has to be held back client needed to be

followed up on email thread and whatsapp one by one all these were fixed with the help of software

- **W20.** Your funniest or most painful stakeholder story from gathering requirements from 20+ people. There must be one.

While gathering the info some where demanding and treating the software like magic wand and wanted it to do all the things they didn't even wanted to touch it all things should be automated we also needed to write the prd such that a flow can be created someday some department where available and somenday not we needed to coordinate online aslo when hd the difference and then needed to synchronize the infirmation in a way that can be delivered to the developers all things were messy.

- **W21.** A moment where two departments wanted opposite things — how did you resolve it?

Not any story for now will talk later

- **W22.** What has UAT taught you that no article about product management could have? That things can break when real user test it. There is lots of story and it has made me feel so tensed and have lost my coll and also needed to find proof here and there so that requirements can be justifies it been a lot
- **W23.** What are you proudest of in the client portal specifically?

Will discuss later

Sapiens.club (the solo build):

- **W24.** Why does Sapiens exist? What's the origin story — whose idea, what problem, why did YOU end up building it alone?

"So I'd love to tell you Sapiens came to me in a dream, but the honest version is better: the idea came from my boss, Anjan Sir. He mentioned it one day — [one line here on the problem Sapiens solves] — and then did what good founders do: planted the seed and trusted me to run with it. No spec, no team, no roadmap. Just 'this should exist.'

So the origin story splits cleanly: the idea, him. Everything after the word 'idea' — me. I took it from a sentence to an actual product: figured out who it's for, what the MVP was, scoped it, picked the stack — Next.js, Supabase, Sanity, deployed on Vercel — and built the whole thing

myself with AI as my only teammate. Which has one interesting side effect: when there's a bug in production, there's exactly one person to blame, and unfortunately I know him personally.

Why alone? Partly circumstance — there was no dev team waiting around. But honestly, partly stubbornness. I wanted to prove to myself that one person with clear product judgment and AI leverage can ship what used to take a small team. Sapiens became that proof. It also permanently changed how I work — I stopped thinking of 'I can't build that' as a valid sentence."

- **W25.** Tell me about the worst technical wall you hit building it solo, and how you (and AI) got through it.

"The code was honestly not the wall. The wall was everything around the code — the stuff no tutorial warns you about. I took Sapiens from idea to website to PRD to a full mobile app for both Apple and Android, solo, and shipping to two app stores as one person is basically a guided tour of things you didn't know existed.

My favorite example: the D-U-N-S number. I'm ready to create my Apple and Google developer accounts, feeling great, and suddenly Apple asks me for a nine-digit business identifier issued by a company I had genuinely never heard of in my life. I thought my blockers would be, you know, engineering problems. Instead I'm at midnight reading about a business registry, wondering how making an app turned into paperwork archaeology.

That was the real pattern of the whole build — unknown unknowns. Certificates, signing, store requirements, platform differences — every week the project revealed a new room I didn't know the building had. What got me through was turning every unknown into a tight loop with AI: I'd hit the wall, ask, actually understand the answer, verify it against the real docs, implement, move on. AI compressed what would've been weeks of forum-digging into hours. But the part I'm proudest of is the discovery itself — AI can answer any question, but when you're solo, figuring out *which questions exist* is entirely your job."

- **W26.** What's a 2 AM shipping story from this project? Every solo builder has one.

"Everyone has a story about staying up till 2 AM. Mine is the reverse, and honestly more embarrassing.

During the heavy development stretch I was pulling so many late nights that I completely lost my sense of time — not as a figure of speech, literally. One morning I woke up and did what I always did: opened the laptop, 'just one quick thing before getting ready for office.' Next time I looked up from the screen, it was 11:30. I wasn't early into my work day — I was extremely late for my actual job, and I had no idea how it happened. Four hours had just... left. My body was at home, my brain was somewhere inside the codebase.

I tell this story because it's the honest texture of solo building — there's no team, no standup, no one to tell you to stop. The flow state that lets one person ship an entire app is the same one that makes you forget you have an office. I've since developed a very sophisticated engineering solution for this: alarms."

- **W27.** What did building Sapiens teach you about AI-assisted development that most people talking about "AI coding" get wrong?

"Most people think AI coding is about speed — generate more code, faster. Having actually shipped a full product this way, I think that misses the point twice.

First, the real unlock isn't speed, it's range. AI collapsed the distance between 'I don't know how to do this' and 'this is done.' I built and shipped for two platforms without a mobile team because every time I hit something I didn't know, the learning curve went from weeks to hours. That's not faster typing — that's one person being able to hold a whole product.

Second — and this is what the hype gets wrong — AI doesn't remove the struggle, it relocates it. It happily writes code that's locally correct and globally incoherent, so my job shifted from writing code to making decisions and enforcing coherence: what to build, what to verify, what to refuse. And AI only answers the questions you ask it. It never once volunteered 'by the way, you'll need a D-U-N-S number' — I had to discover that the hard way. So the skill isn't prompting. It's product judgment plus the humility to verify. AI amplifies whoever has the clearest thinking; it doesn't substitute for it. I still run Sapiens through Claude Code today, and the workflow is the same: I direct, it executes, I review."

- **W28.** What's the current state and the dream state for Sapiens?

"Current state: the MVP is complete and in testing. And I want to be precise about what 'complete' means here, because I've earned the right to be — it's not a landing page

and a waitlist. It's the full journey: idea, website, PRD, and a working mobile app built for both Apple and Android, shipped by one person. Right now it's in the testing phase — finding the rough edges before real users do, which is my favorite phase because every bug I catch now is a one-star review that never gets written.

- Dream state: People getting real help making real connection and having real bond.. Making helping and having physical interaction with one another real and cool once again. But honestly, my nearer-term dream is simpler and more measurable: real users, on both stores, telling us something we didn't expect. An MVP is a hypothesis — the dream is earning the data to make version two smarter than version one. And whatever Sapiens becomes, it's already proven its first thesis: that one person with product judgment and AI leverage can take an idea from a sentence to the app stores. Now the question is what happens when users get their hands on it — and I genuinely can't wait to find out."

D. Opinions & takes

(Websites with a point of view get remembered. Give me your spiciest.)

- **W29.** What's a contrarian opinion you hold about product management?

Need your help in understanding this

- **W30.** What's a contrarian opinion you hold about SEO/growth in the AI era?

Need your help in understanding this

- **W31.** What do you think most people get wrong about "AI-native" work?

They think you don't do anything no proof checking no quality check you just give prompt but there is lots of planning and technical know how to make a product that doesn't fail once you open it.

- **W32.** A prediction you'd bet money on for the next 3 years?

AI will be integral part of all the work and prompting and basic tech education will be integral part although you can also provide me with some suggestion on how future will be looking.

- **W33.** A popular tool, framework, or PM ritual you think is overrated?

I dont have any opinion on that you can help me to identify that if possible.

E. What you want next

- **W34.** Describe your dream next role in one honest sentence — not the job-description version.

I wanna enjoy what i do and making real things and seeing its impacts gives me happiness so i wanna be part of some team who is creative and care about what they are building more than the money I believe in values peace and feeling of being content with what i do.

- **W35.** What kind of founder or team would you *love* to work with? What kind would you run from?

I would love to work with people who are honest upfront work load doesn't fear me but anyone who is not clear and says something else and do something else i have fear from that kind of personality i wanna be working with someone ambitious who want to make real impact

- **W36.** If a founder gave you a fuzzy problem and 90 days, what would your first two weeks look like?

I will identify all the possible questions that will help me identify the solution to the problem. I will talk to people generally who dont have odea about that and take their perspective in layman language then i will put down all my finding and research on the glass by writing it with my marker and then i will separate them in the box depending on their relevancy to each other then i will decide at which step i will solve them and then i will wok on phase+ chunk wiese manner on all the identified questions thwn i will make the PRD and then start implementing one section at a time and then make a MVP test it take feedback improve it and solve that problem. I love questions I ask lots of questions from myself and everyone else around me because for me questions leads to answer and that decide the entire path.

- **W37.** What are your non-negotiables in the next role?

Honesty, Real Impact and truthfulness and have a very collaborative environment without office politics. Money is my secondary priority.

F. Receipts

- **W38.** Any testimonials, appreciation messages, client quotes, or Slack/WhatsApp screenshots praising your work? Paste them raw (I'll ask permission before using any).

Not for now we will attach it later

- **W39.** Any dashboards, graphs, or screenshots you can share for the case studies (Search Console curves, follower growth, etc.)?

Dont need for now we will ad it later

- **W40.** Awards, recognitions, or "unofficial titles" you've earned anywhere?
The everything guy i can do anything whether I have done it or not

SECTION 2 — PERSONAL

Raw material for the "Know Me" door. This is where the biographer part kicks in — over-share here.

A. The origin story

- **P1.** Samastipur → Ranchi → Bhubaneswar → Pune. Walk me through the journey. What did each place give you or teach you?

I had a very interesting childhood I used to live in patna and I stared my school journey when I was 3 year old. I was in Holy mission Patna till class 1 where I was the crowd favourit

- **P2.** What kind of kid were you? The one detail that captures 10-year-old Pragaman.
- **P3.** Tell me about your family — not names and details, just: how did they shape the way you think and work?
- **P4.** First memory of a computer or the internet? What did you do with it?

- **P5.** What were you known for in school? Any legendary incident?
- **P6.** The KIIT years — what actually happened in those four years beyond the CGPA? Hostel stories, the friend group, what you built or broke?
- **P7.** Was there a hard chapter in the journey — a rejection, a failure, a low period — that shaped you? (Tell me even if it's [PRIVATE]; it helps me understand the arc.)
- **P8.** What does moving to Pune alone and working full-time feel like? What's surprised you about adult life?

B. The Graveyard — your unfinished ideas

(Your idea, and it's brilliant. Let's mine it fully.)

- **P9.** List EVERY project or idea you started and abandoned — or thought about so hard you basically started it. For each one give me:
 - What it was (one line)
 - How far you actually got (an idea in the shower / a Notion doc / a half-built repo / a domain you bought)
 - The official excuse for abandoning it
 - The real reason 😊
- **P10.** Which graveyard resident do you secretly believe was a billion-dollar idea?
- **P11.** Which one might you actually resurrect someday?
- **P12.** Beyond projects — any abandoned hobbies, 3-day gym memberships, half-read books, languages you learned for a week? The graveyard has many wings.

C. Daily life & quirks

- **P13.** Describe your daily routine honestly — including the parts you'd never put on LinkedIn.
- **P14.** Describe your desk/room setup. What's the weirdest thing on or near your desk?

- **P15.** What are your weird habits? (Everyone has 3 minimum. Think: how you eat, how you sleep, rituals, superstitions.)
- **P16.** Something you're weirdly GOOD at that has zero career value?
- **P17.** Something you're embarrassingly BAD at that people assume you'd be good at?
- **P18.** Your most irrational fear or dislike?
- **P19.** Chai or coffee — and defend your answer like your life depends on it. Any other food/drink hills you'll die on? (Is biryani overrated? Does elaichi ruin everything? Take stands.)
- **P20.** What do you do when nobody's watching and you have a free evening?

D. Taste — what you consume

- **P21.** Music: what's actually in your playlists? Guilty pleasures included. One song you've overplayed to death?
- **P22.** Shows & movies: comfort rewatch? All-time favorite? Something you love that you're mildly embarrassed about?
- **P23.** YouTube rabbit holes you fall into at 1 AM?
- **P24.** What genre of meme resides in your soul? What never fails to make you laugh?
- **P25.** Books/podcasts/creators that actually changed how you think? (Skip if reading lives in your graveyard — that's an answer too.)
- **P26.** Food: the one home dish you'd defend in war? Your go-to order? Your comfort food after a bad day?

E. People & how they see you

- **P27.** How would your closest friends describe you in one brutal, honest line?
- **P28.** What do people tease you about? (This is prime website material — self-deprecation lands best when it's real.)
- **P29.** Any nicknames, and the stories behind them?
- **P30.** What's your role in the group chat / friend group? (The planner? The meme supplier? The one who leaves everyone on seen?)
- **P31.** What's something people consistently get WRONG about you on first impression?
- **P32.** Who's been the biggest influence on you, and what's one thing they said that stuck?

F. Beliefs, dreams & oddities

- **P33.** The bucket list — the real one. Big dreams and stupid small ones both. (I know New Zealand is on it — why? What's the pull?)
- **P34.** If money didn't matter, what would you spend a year doing?
- **P35.** Your most unpopular non-work opinion? (The one that starts arguments at dinner.)
- **P36.** What tiny, everyday things bring you disproportionate joy?
- **P37.** What do you believe about life/work/people that most 22-year-olds don't?
- **P38.** What's a rule you live by — stated or unstated?
- **P39.** What are you secretly optimizing your whole life for?

G. Surprises & stories

- **P40.** The most unexpected fact about you — the one that makes people go "wait, WHAT?"
- **P41.** Your best party story — the one you've told 20 times and it still lands.
- **P42.** A failure that was painful then but is genuinely funny now.
- **P43.** A talent or party trick nobody expects from you?
- **P44.** The most spontaneous thing you've ever done?
- **P45.** A small act of kindness (done by you or for you) that you still remember?

H. Rapid fire ⚡

(One line each. First instinct. Don't overthink.)

- **P46.** Early bird or 3 AM creature?
- **P47.** Your phone's screen time says...?
- **P48.** Most-used emoji?
- **P49.** Last thing that made you laugh out loud?
- **P50.** iOS or Android, and how strongly?
- **P51.** Your search history right now would reveal...?
- **P52.** One app you'd delete forever if you could?
- **P53.** Text back immediately or "seen, 4 hours ago"?
- **P54.** Beach, mountains, or hotel room with good WiFi?
- **P55.** Your walk-out song if life had one?
- **P56.** What would your autobiography be titled?
- **P57.** In an apocalypse, your role in the survivor group is...?
- **P58.** One thing in your online cart right now?
- **P59.** Your 3 AM thought last week?
- **P60.** If your laptop could talk, its first complaint would be...?

SECTION 3 — THE SITE ITSELF

Practical inputs so I build the right thing.

- **S1.** Drop your design references — links or screenshots of sites/vibes you love (you mentioned you have some). For each: what specifically do you like about it?

I have told you about the Josh W cOMEAU website and we can use that reference

- **S2.** Photos: do you have good photos of yourself? Formal, candid, childhood? Would you be open to a slightly playful photo treatment in Know Me mode (doodles, stickers, captions)?

Will price that later when we have prepared the complete PRD I will upload that in the required folder.

- **S3.** Colors/aesthetics you love — and any you hate?
We have decided on that already
- **S4.** Any section ideas beyond The Graveyard? (You said you'd add more "unexpected yet relatable" ideas — dump them all here, even half-formed.)
We have decided on that also
- **S5.** Easter eggs: any inside jokes, hidden interactions, or surprises you'd love hidden in the site? (E.g., something happens if you click the toggle 10 times.)
I will need your help for this to make our website interesting suggest me ideas then i can add onto that okay
- **S6.** What's the ONE feeling a founder should have after leaving Work mode? And the ONE feeling anyone should have after leaving Know Me mode?
They should feel they got to know someone interesting and at least they should remember 1-2 things about me and have a little laugh.
- **S7.** Anything absolutely OFF-LIMITS for the website — topics, photos, family details, anything?

Faimly details

- **S8.** Should visitors be able to contact you from the site? (Email, LinkedIn, a fun "pitch me an idea" box?)

We have discussed this already

- **S9.** Domain plans — keeping the Vercel subdomain or buying something like pragaman.com?

Vercel for now will buy pragaman.com after developing the complete website.

Fill it messy. Skip what's dead. Over-answer what's alive. Send it back and I'll turn it into a person on the internet.
